- Is a **tweets analyzer** which extracts semantic information to know if the general tweets feeling about a topic is positive or negative.
- **Web**: http://tweetssentiment.com/
- **Twitter**: http://twitter.com/TweetsSentiment

1.5 WHERE TO FIND ME?

- My nick: **asanzdiego**

- AboutMe: http://about.me/asanzdiego
  - GitHub: http://github.com/asanzdiego/
  - Twitter: http://twitter.com/asanzdiego
  - Blog: http://asanzdiego.blogspot.com.es
  - LinkedIn: http://www.linkedin.com/in/asanzdiego

1.6 LICENCE

- **This work is licensed under a:**
  - Creative Commons Attribution 3.0
- **The program source code are licensed under a:**
  - GPL 3.0

2 INSTALATION AND HOW TO USE

2.1 DEPENDENCIES

- Pandoc (needs to be installed)
- Phantom.js (needs to be installed)
- Reveal.js (included)

2.2 CREATION

- First **copy the doc folder and rename it as you like**. This is not necessary but helps you organize your documents.

- **Create the md files** that you want to generate. The md files are Markdown files which are nothing more than plain text files with extension md, and a lightweight markup (we should know it but it is very simple).

- Once created the md files, we can **generate html, html-slides y pdf-beamer with a script**.

2.3 BUILD

- To **convert all md files of all the folders** go to the root folder and execute:

```
./build.sh
```

- To **convert all md files of one folder** go to the root folder and execute:

```
./build.sh [folder_name]
```
